

what is ...

OSMOSIXS is the first sport product in the world to make use of a **medical discovery**. **OSMOSIXS** is a system of clothing items which all share the feature of being designed to be applied to a sporting concept.

It is the application of the patented **LVM technology** for a molecular film which retains active ingredient nanoparticles in the fabric (made specifically for this purpose) and releases them at a constant rate after the item is put on.

The first active ingredient which we charge **OSMOSIXS** with is **CARNOSINE**. **CARNOSINE** is the enemy of lactic acid and its consumption allows for the delay of all the problems caused by the build-up of lactic acid in the muscles during physical exercise.

Only 10% of Carnosine is metabolised when taken orally. **OSMOSIXS**, with its system of transdermal osmosis, is 100% absorbed.

IT IS NOT a performance-enhancing substance, it does not increase already developed strength, but allows it to be fully developed for longer periods without experiencing **CRAMPS**, muscle stiffness, **LOSS OF STRENGTH** which are caused by the build-up of lactic acid in the muscles.

Once used, **OSMOSIXS** items can be easily recharged with **CARNOSINE** by soaking them in a water-based solution with a recharging dose. **ONLY OSMOSIXS** items can be charged, the use of the recharging solution on any other garment is completely ineffective.
